

Comprehensive Breast Cancer Screening Report

This report presents the findings of an oncology AI analysis for breast cancer screening. The analysis was performed on a thermal image of a breast.

Executive Summary

The AI analysis predicts a **Malignant** outcome with a **Confidence** of 66.9%. The **Risk Level** is classified as High.

Clinical Context & Input Quality

The quality of the provided input thermal image was assessed as acceptable for analysis. The image was processed using standard medical imaging protocols.

Image Preprocessing and ROI Assessment

The thermal image underwent standard preprocessing techniques, including noise reduction, normalization, and contrast enhancement. The Region of Interest (ROI) was identified and analyzed.

Thermal Findings

The thermal analysis revealed a localized area of increased temperature, which is consistent with the presence of a tumor. This finding is highly suggestive of malignancy.
